Software Development Engineer

As a Development Engineer in our Research & Development department, you are responsible for developing software solutions for smart applications in the intralogistics sector. Your primary focus is on back-end development, creating software that integrates with various systems such as robotics or vision systems.
You collaborate closely with 5 enthusiastic colleagues from different disciplines. In addition to writing and developing code, you play a key coordinating and advisory role, guiding other departments through the development process and software architecture.

- Design and implement a strong software architecture;

- Develop reusable software solutions;

- Contribute to long-term (R&D) software developments;

- Research new technologies that add value to our applications;

- Conduct feasibility tests for new software innovations;

- Share knowledge with colleagues and support team growth;

- Demonstrate and validate your software developments.
