

# System Administrator

## What will you be doing?

As a Systems Administrator within IT Operations, you will be responsible for the management and further development of our IT infrastructure. You will ensure that systems function optimally and are continuously available – both at our head office and at our international branches. An occasional visit to one of our overseas locations? A varied aspect of the role that appeals to you.

You will work on a wide range of issues: from resolving complex faults to implementing new technologies such as Azure solutions. You will have considerable freedom to implement improvements and will actively contribute ideas regarding the future of our IT environment.

In addition you:

- Manage and optimise the IT infrastructure (networks, servers, firewalls and SD-WAN);
- Ensure secure and reliable systems through security measures and vulnerability checks;
- Work on backup and disaster recovery solutions to safeguard data and business continuity;
- Manage applications and ensure that software is up to date and functioning properly;
- Handle complex second-line incidents and keep services running smoothly.

Together with your colleagues, you will ensure that IT is not a bottleneck, but rather a catalyst for the organisation.
