

Supply Chain Engineer

As a Supply Chain Engineer, you play a central and versatile role within our organisation. You are responsible for the logistics process of parts, from procurement to production, and ensure that these are available on time and within budget to make projects run smoothly.

You will be closely involved from the engineering phase onwards, allowing you to think about the supply chain at an early stage. You continuously monitor the progress of the procurement process and work to ensure the smooth and effective handling of any quality issues. You will also ensure proper coordination with the project coordinator and other departments, such as mechanical and hardware engineers, as well as our other sites.

An important part of your role involves monitoring delivery times, accurately processing orders in our ERP system and maintaining strong relationships with suppliers. By switching quickly and steering cost-conscious processes, you will contribute to the timely and successful completion of projects, without delays due to quality issues.
