

Mechanical Engineer

As a Mechanical Engineer, you will design AWL machines based on known or new concepts. We supply these machines mainly to customers in the logistics industry. What is eventually built on the floor is 'our' product. You are really working on something concrete. In this versatile position, you will develop the design concepts, support or organise concept testing, be responsible for the mechanical design, procurement specifications and have an active role in the project team. You have regular contact with customers, suppliers and our other Engineering disciplines. You will contribute to the further development of our standards and concepts. Depending on your wishes and ambitions, you can progress to Lead Engineer, for example!
